

Q4. Factorial of a number using a function

Python Code:

```
def factorial(n):
    if n < 0:
        return None
    result = 1
    for i in range(2, n + 1):
        result *= i
    return result

num = int(input("Enter a number: "))
print("Factorial of", num, "is", factorial(num))
```

Sample Output:

```
Enter a number: 5
Factorial of 5 is 120
```
