

Q10. Operations on a list of 20 student marks

Python Code:

```
from statistics import mode

marks = [78, 92, 55, 88, 67, 45, 99, 73, 61, 84,
         55, 67, 90, 88, 73, 40, 67, 85, 92, 60]

# 1. Average marks
average = sum(marks) / len(marks)
print("Average marks:", average)

# 2. Number of students scoring more than average
count_above = 0
for m in marks:
    if m > average:
        count_above += 1
print("Number of students above average:", count_above)

# 3. Marks scored by maximum number of students
most_common_mark = mode(marks)
print("Marks scored by maximum students:", most_common_mark)
```

Sample Output:

```
Average marks: 72.95
Number of students above average: 11
Marks scored by maximum students: 67
```
